The Museum

What a miserable place! Hassan thought as the family arrived at the Transport and Technology Centre.

His dad had seen an advert for this new museum in the local newspaper and afterwards had remarked, "I think community projects like this need supporting."

"I see your point," his mum had responded with enthusiasm. "We must all go."

The faded photos of camels trekking across vast, bare landscapes were boring and repetitive. As far as Hassan was concerned, these exhibits were inferior to the studies he had done at school on the topic. Whilst he took a few useless, uninspired snapshots with his camera, he thought to himself, *Oh, it's going to be a long day! I will survive this provided that I visit the restaurant on the second floor and not stay long.*

However, when his father, who had always been enthusiastic about trains, saw the first-floor display, he insisted they look at it. "Trains are fascinating!" he gushed, eagerly. "I love being kept informed about new railways that are being built."

In Hassan's opinion, most of this exhibition seemed just like the last one, with faded images and dull charts of designs and statistics. He did find the letters and diary entries, which highlighted the problems the engineers had encountered whilst the work progressed, absorbing, but that was all.

Hassan really needed cheering up by the time they reached the second floor. He had become aware of some beeps and buzzes whilst they travelled up in the elevator with a crowd of other visitors. As everyone slowly got out, Hassan realised what those noises that he had heard were, and he laughed. The floor was full of robotics and virtual reality games about transport. Hassan enjoyed being tested on his reactions and response skills, so this place was perfect for him.

He was astonished by the racing car game, which he'd never played before, because it was complicated and challenging. He could achieve high scores as long as he concentrated hard and paid full attention to it. This floor was so entertaining that the whole afternoon had passed before the family realised that they hadn't even eaten. They didn't leave until closing time!

Changes to Healthcare

For a lucky few, the advantage of technology is that they become a well-known celebrity by creating a website. The benefit of technology for most people who use it, however, is that they can message and talk with friends and post photos and comments. Many people use social media to connect with other individuals, but technology also benefits the wider community, especially in healthcare.

One advantage of using the internet to research symptoms is that it is a quick way of avoiding unnecessary doctor visits, provided you think about the information you read carefully. Panic might be felt as a consequence of symptoms of a minor illness being mistaken for those of a more serious one. If you take care, using the internet to find treatments for general aches and pains is easy and fast. It's probably going to be unnecessary to visit the doctor with minor health issues in the future due to online assistance.

Computerised records, which hold all the information about patients' health and medication in one place, ensure that doctors have all the relevant information about patients. Before digital systems were used, rooms had been filled with paper files which could get lost or damaged. Now doctors and nurses feel more confident that they have all the relevant data. It is thought that patients probably benefit even more than the doctors, knowing that all their previous health history is available to staff every time they visit the hospital or clinic. Similarly, worried family members don't need to be upset with intrusive questions about loved ones during difficult times. A disadvantage of relying on this technology is that medical staff may need training in computer skills. Computerised records are easy to access, on the condition that people know how to use the technology.

Advanced testing equipment provides more efficient feedback to patients. Before modern testing methods became available, patients had waited longer for results to arrive, the consequence of which was delayed treatment that harmed their chance of a full recovery. Nowadays, treatments are not delayed for long. Samples can be analysed immediately after they are taken and the results are sent by email, cutting waiting time dramatically. As far as healthcare professionals are concerned, fast responding equipment is essential. Overall, health benefits are going to increase even more as new technology is developed.

- c. have to annoy people whilst gathering information ☐

Changes to Healthcare

For a lucky few, the advantage of technology is that they become a well-known celebrity by creating a website. The benefit of technology for most people who use it, however, is that they can message and talk with friends, post photos and comments. Many people use social media to connect with other individuals, but technology also benefits the wider community, especially in healthcare.

One advantage of using the internet to research symptoms is that it is a quick way of avoiding unnecessary doctor visits, provided you think about the information you read carefully. Panic might be felt as a consequence of symptoms of a minor illness being mistaken for those of a more serious one. If you take care, using the internet to find treatments for general aches and pains is easy and fast. It's probably going to be unnecessary to visit the doctor with minor health issues in the future due to online assistance.

Computerised records, which hold all the information about patients' health and medication in one place, ensure that doctors have all the relevant information about patients. Before digital systems were used, rooms had been filled with paper files which could get lost or damaged. Now doctors and nurses feel more confident that they have all the relevant data. It is thought that patients probably benefit even more than the doctors, knowing that all their previous health history is available to staff every time they visit the hospital or clinic. Similarly, worried family members don't need to be upset with intrusive questions about loved ones during difficult times. A disadvantage of relying on this technology is that medical staff may need training in computer skills. Computerised records are easy to access, on the condition that people know how to use the technology.

Advanced testing equipment provides more efficient feedback to patients. Before modern testing methods became available, patients had waited longer for results to arrive, the consequence of which was delayed treatment that harmed their chance of a full recovery. Nowadays, treatments are not delayed for long. Samples can be analysed immediately after they are taken and the results are sent by email, cutting waiting time dramatically. As far as healthcare professionals are concerned, fast responding equipment is essential. Overall, health benefits are going to increase even more as new technology is developed.
