### The Great Pacific Garbage Patch

Floating in the middle of the Pacific Ocean is a country-sized island of plastic waste called the Great Pacific Garbage Patch. While we know that the Great Pacific Garbage Patch would have started to form in the 1950s, when plastic production from fossil fuels surged driven by its versatile applications and affordability, it was only a 1988 study which hypothesised its existence due to concentration of plastics in certain parts of the ocean. It was first formally spotted, though, by a yacht racer called Charles Moore in the late 90s.

The Great Pacific Garbage Patch is the outcome of various human activities, including improper waste management and excessive plastic consumption. The throwaway culture, coupled with inadequate recycling infrastructure, has resulted in vast amounts of plastic waste entering waterways and eventually accumulating in the patch. Additionally, coastal populations and shipping activities contribute to the problem, as debris is carried by rivers and ocean currents over long distances. The overwhelming
