The Periodic Table and Periodic Law

Section 1

Development of the Modern Periodic

MAIN IDEA :

The periodic Table evolved over time as scientists discovered more useful ways to compare and organize the elements

Dictionary

word	meaning	word	meaning	word	meaning
categories	فئات/اقسام	struck	يصطدم	resin	راتنج
Element	العنصر	brittle	هش	prosthetics	اطراف صناعية
Compound	المركب	dull	غير لامع	fabrication	تصنيع
Atomic mass	الكتلة الذرية	abundant	وفرة	column	عمود
Atomic number	العدد الذري	scientists	العلماء	seemingly	علي ما يبدو
Periodic table	الجدول الدوري	submarine	الغواصة	refrence	مرجع
Periodic law	القانون الدوري	metalloids	اشباه الفلزات	Stair step line	علي جانبي الخط المتعرج
contributions	اسهامات/ جهود	extensively	علي نطاق واسع	trend	اتجاه
demonstrated	اظهر	chips	رقائق	hampered	يعيق
representative	الرئيسية/ الممثلة	Solar cell	الخلايا الشمسية	Octaves law	قانون الثمانيات
inflammable	قابل للاشتعال	clay	الطين	mercury	الزئبق
malleable	قابل للطرق	duuctile	قابل للسحب	light	خفيف
chalk	طباشير	charcoal	الفحم	lifelike	نابض بالحياه
familiar	مألوف	transition	الانتقالية	Alkali metals	الفلزات القلوية
nonmetals	اللافلزات	Noble gases	الغازات الخاملة	halogens	الهالوجينات
emit	يشع/ يصدر	lanthanide	اللانثانيدات	actinide	الاكتينيدات
apparent	واضح	several	العديد	properties	خواص
By increasing	بزيادة	repetition	نمطية/ تكرارية	devices	اجهزة

تمنيتي لجميع الطلبة والطالبات بالتفوق والنجاح
أ. نعيم الامام عقل

Item	Definition
Periodic Law	Is periodic repetition of chemical and physical Properties of the elements when they are arranged by increasing atomic number
Representative elements(main group)	That elements in groups 1,2 and 13 to 18 possess a wide range of chemical and physical properties
Transition elements	That elements in group 3 to 12
Metals	Elements that are generally shiny when smooth and clean, solid at room temperature, and good conductors of heat and electricity
Alkali metals	That elements in group 1 (except hydrogen)
Alkaline earth metals	That elements in group 2
Non-metals	Are elements that are generally gases or brittle, dull-looking solids
halogens	That elements in group 17, are often part of compound
Noble gases	The extremely unreactive group 18 elements
Metalloids(semimetals)	That elements found in bordering the stair step line

✓ Development of the periodic table

Scientist	Contributions
Antoine Lavoisier (1743-1794)	<ul style="list-style-type: none"> ➤ Compiled a list of elements that were known at the time (33 elements) ➤ Organized elements in 4 groups: gases, metals, nonmetals and earths
J. Newlands (1837-1898)	<ul style="list-style-type: none"> ➤ Arranged elements by increasing atomic mass ➤ Noticed the repetition of properties every 8 elements ➤ Created the law of octaves
Lothar Meyer (1830-1895)	<ul style="list-style-type: none"> ➤ Demonstrated a connection between atomic mass and elements properties ➤ Arranged the elements in order of increasing atomic mass
Dmitri Mendeleev (1834-1907)	<ul style="list-style-type: none"> ➤ Demonstrated a connection between atomic mass and elements properties ➤ Arranged the elements in order of increasing atomic mass ➤ Predicted the existence and properties of undiscovered elements ➤ Arranged elements with similar chemical properties horizontally. He left empty spaces for elements that were not yet discovered
Hennery Moseley (1887-1915)	<ul style="list-style-type: none"> ➤ Discovered that atoms contain a unique number of protons called atomic number ➤ Arranged the elements in order of increasing atomic number, which resulted in a periodic pattern of properties

✓ The modern periodic table

- Consists of boxes , each containing an element name, chemical symbol,atomic number ,atomic mass and its state.
- Elements arranged in order of increasing atomic number
- Consistes of 7 periods (horizontall rows) and 18 groups (families)
- Elements are classified as: metals, nonmetals and metalloids
- Alkali metals(group 1) exist as compounds ? because they are reactive

period	group
<ul style="list-style-type: none"> ➤ horizontall rows ➤ periodic table Consistes of 7 periods ➤ different chemical properties 	<ul style="list-style-type: none"> ➤ Vertical columns ➤ periodic table Consistes of 18 groups ➤ have the same chemical properties

Metals	Nonmetals
<ul style="list-style-type: none"> ✓ all solids except Hg (Mercury) ✓ Shiny ✓ Good conductors of heat and electricity ✓ Malleable:they can be pounded into thin sheets ✓ Ductile:they can be drawn into wires ✓ Most of representative elements and all transition elements are metals High melting points 	<ul style="list-style-type: none"> ✓ Solids – liquid(Br) -bromine and gases ✓ Dull- brittle ✓ They ae poor conductors of heat and electricity ✓ Non malleable ✓ Non ductile ✓ To the right of the periodic table Low melting points (some are even gases at room temperature)

✓ Metalloids

- They have physical and chemical properties of both metals and non metals
- They are found in the stair step line in periodic table
- They are bordering the staircase line in periodic table
- Known as semimetals or semiconductors
- Examples: silicon (Si) – germanium (Ge)

✓ Transition metals

- Divided into transition metals and inner transition metals
- Inner transition metals are two sets: lanthanide series and actinide series

Lanthanide series	actinide series
<ul style="list-style-type: none"> ✓ 14 elements ✓ Found in period6 ✓ From cerium($_{58}\text{Ce}$) to lutetium ($_{71}\text{Lu}$) ✓ Used extensively as phosphors substance that emit light when struck by electrons because it is strong and light 	<ul style="list-style-type: none"> ✓ 14 elements ✓ Found in period7 ✓ From thorium($_{90}\text{Th}$) to Lawrencium ($_{103}\text{Lr}$) ✓ Radioactive elements
<ul style="list-style-type: none"> ✓ They are located along the bottom of periodic table ✓ They are block F 	

✓ Halogens(group17)

- Very active nonmetals like group1,2
- Are often apart of compounds

✓ Nobel gases(group18)

- Extremely un reactive elements (stable)that they undergo virtually no chemical reaction
- Are used in lasers, avariety of light bulbs and neon signs

Element/Compound	uses
Sodium Na	One of compound of salt
Lithium Li	Often used in batteries
Ca , Mg	Important for health
Magnesium (Mg)	In fabrication of electronic devices such as laptop because Mg : solid and relative light
Titanium (Ti)	Make frames for bicycles and eye glasses
Compound of Fluorine(F)	Are commonly added to toothpaste and drinking water to prevent tooth decay
Si , Ge	Used in extensively in computer chips and solar cells
Silicon(Si)	Make prosthetics or in lifelike applications

Notes:

- Periodic law can be used to predict un known elemental properties.
- Mandeleev predict the properties of the yet to be discovered elements scandium , gallium and germanium
- Newlands noticed that the properties of elements repeated every 8 element, in the same way musical notes repeat every 8 note and form octave

Section 2

Classification of the elements

Main idea :

- ✓ elements organized into different blocks in the periodic table according to their electron configurations
- ✓ Chemical elements are identified according to details about the arrangements of their electrons

word	meaning	Word	meaning
fortunately	لحسن الحظ	predictable manner	بطريقة يمكن التنبؤ بها
Electron configuration	التوزيع الإلكتروني	synthetized	تم تصنيعها في المختبر

✓ Organizing the elements by electron configuration

- You can determine an atoms electron configuration and its number valence electrons from its position on the periodic table
- Atoms in the same group have similar chemical properties ? because they they all have the same number of valence electrons
- The group 1 elements have similar chemical properties (why?)because they they all have the same number of valence electrons(1 electron) ns^1 or have single electron in their out most orbitals
- Each group 2 element has a valence electron configuration of ns^2
- Each groups 1,2, and 13 to 18 on the periodic table has its own valence electron configuration

Item	definition
Valence electrons	That electrons in the highest principal energy level of an atom

✓ Valence electron of representative elements

Group	valence electrons
1	1e
2	2e
13	3e
14	4e
15	5e
16	6e
17	7e
18	8e ethe exception of helium which has only (2) valence electron

	s-block	p-block	d-block	f-block
group	Two groups : 1, 2	Six groups 13,14,15,16,17,18	Ten groups: 2 → 12	Between 3,4
location	Left of periodic table	Right of periodic table	Middle of periodic table	Down of periodic table
Kind of elements	Have representative elements	Have representative elements	Have transition elements	Have inner transition metals
Prop.	<ul style="list-style-type: none"> Group 1: elements have partially filled s orbitals containing one valence electron (ns^1) Group 2: elements have completely filled s orbitals containing 2 valence electrons (ns^2) 	<ul style="list-style-type: none"> There are no p-block elements in period 1 because the p sub-level doesn't exist for the first principle energy level ($n=1$) The first element in block p is Boron comprise noble gases which are stable 	<ul style="list-style-type: none"> largest of the blocks are usually characterized by a filled outer most orbital of energy level (n) and filled or partially filled d orbital of energy level ($n-1$) 	<ul style="list-style-type: none"> are usually characterized by a filled outer most orbital of energy level (n) and filled or partially filled f orbitals the electrons of f sublevel do not fill their orbitals in a predictable manner

- The electron dot structures illustrate the connection between group number and number of valence electrons
- The S,P,d,f block elements
- The periodic table has columns and rows of varying sizes
- The periodic table is divided into 4 distinct blocks s,p,d,f
Because there are 4 different energy sublevels s,p,d,f filled with valence electrons

periods	block	elements
Period 1	Contains only S-block elements	2
Period 2 and 3	Contains S and p-block elements	8
Period 4 and 5	Contains S, p and d-block elements	18
Period 6 and 7	Contains S, p, d and f-block elements	32

Notes:

- ✓ the p-block spans six groups why? because the 3 p orbitals can hold a total of six electrons
- ✓ the 4s orbital is filled before the 3d orbitals (why)?
Because the 4s orbital has a lower energy level than the 3d orbitals (Aufbau principle)
- ✓ the d-block spans 10 groups why? because the 5 d orbitals can hold a total of ten electrons
- ✓ the f-block spans 14 columns of the periodic table (why)? Because there are 7 f orbitals holding up to a maximum of 14 electrons
- ✓ the s-p-d and f blocks determine the shape of the periodic table
- ✓ The Period in the periodic table: the energy level of an element's valence electrons

element	Electron Configurations	Period(principa l energy level	(valence electron)	Group	block	Kind of element

Section 3

Periodic trends

Main idea : trends among elements in the periodic table include their sizes and their abilities to lose or attract electrons

word	meaning	word	meaning	word	meaning
calendar	التقويم	Periodic trends	تدرج خواص العناصر	shield	حاجب/حاجز
Keeping track	تتبعية	lose	يفقد	principal	الرئيسي
Atomic radius	نصف القطر الذري	Further more	علاوة على ذلك	less likely	اقل احتمالية
aneighboring atom	ذرة مجاورة	Electrostatic repulsion	تنافر الكترولستاتيكي	Octet rule	قاعدة الثمانية
adjacent	مجاور	corresponding	المقابل	reinforce	يعزز
bonded	المرتبط	offsets	ازاحة	holds onto	يمسك على
acquire	يتطلب / يكتسب	occupied	مشغول	smoothly	بسلاسة
twofold	ثنائي	closer	متقارب	in similar manner	بطريقة مماثلة
gain	يكتسب	successive	التالي	Electronegativity	السالبية الكهربية

Item	difinition
Atomic size	Is defined by how closely an atom lies to aneighboring atom
Atomic radius	Half the distance between adjacent nuclei in crystal of the element
ion	Is an atom or abonded group of atoms that have appositve or negative charge.
Ionization energy	The energy required to remove an electron from agaseous atom
The first ionization energy	The energy required to remove the first outermost electron from an atom
Second ionization energy	The energy required to remove asecond electron from +1 ion
third ionization energy	The energy required to remove athird electron from +2 ion
Octet rule	States that atoms tend to gain , lose , or share electrons in order to to acquir afull set of 8 valence electrons
electronegativity	The relative ability of its atoms to attract electrons in achemical bond

Atomic radius

Trends within periods

- ✓ When we move from left to right atomic radius **decrease**(why?) **because** the positive charge in the nucleus increase with increasing of atomic number and the principal energy level with the period remain the same
- ✓ Each successive element has one additional proton and electron and each additional electron is added to orbitals corresponding to the same principal energy level
- ✓ Moving across a period, no additional electrons come between the valence electrons are not shield from the **increased nuclear charge** which pulls the outermost electron closer to the nucleus.

Trends within groups

- ✓ When we move from up to down atomic radius **increase**(why?) **because** the outermost orbital increases in size along with increasing principal energy level thus atom become larger
- ✓ By increasing the atomic number nuclear charge increases and electrons are added to orbitals corresponding to successively higher principal energy levels however the increased nuclear charge does not pull the outer electrons toward the nucleus to make atom smaller
- ✓ The larger orbital means that the outer electrons are farther from the nucleus this increased distance offsets the pull of the increased nuclear charge
- ✓ **The additional orbitals** between the nucleus and the outer electrons are occupied, the electrons shield the outer electrons from the nucleus

Figure 10 Atomic radii depend on the type of bonds that atoms form.

Bonded metallic sodium atoms in a crystal lattice

The radius of a metal atom is one-half the distance between two adjacent atoms in the crystal.

Bonded nonmetal hydrogen atoms in a molecule

The radius of a nonmetal atom is often determined from a molecule of two identical atoms.

1	2	13	14	15	16	17	18
H 37	He 31						
Li 152	Be 112	B 85	C 77	N 75	O 73	F 72	Ne 71
Na 186	Mg 160	Al 143	Si 118	P 110	S 103	Cl 100	Ar 98
K 227	Ca 197	Ga 135	Ge 122	As 120	Se 119	Br 114	Kr 112
Rb 248	Sr 215	In 167	Sn 140	Sb 140	Te 142	I 133	Xe 131
Cs 265	Ba 222	Tl 170	Pb 146	Bi 150	Po 168	At 140	Rn 140

Ionic radius

- ✓ Formation of ions affects the size of an atoms
- ✓ Atoms can gain or lose one or more electrons

Formation cation(+)	Formation anion(-)
<ul style="list-style-type: none"> ✓ Atoms lose valence electrons from outer orbital ✓ Result : smaller radius (why?) Because that experience a greater nuclear charge allowing these remaining electrons to be pulled closer to the positively charged nucleus. <p>Sodium atom (Na) [Ne]3s¹ → Sodium ion (Na⁺) [Ne]</p>	<ul style="list-style-type: none"> ✓ Atoms gain electrons and form negatively charged ions ✓ Result : larger radius (why?) Because the addition of an electron to an atom increases the electrostatic repulsion between the atoms outer electrons forcing them to move farther apart the increased distance between the outer electrons <p>Chlorine atom (Cl) [Ne]3s²3p⁵ → Chlorine ion (Cl⁻) [Ne]3s²3p⁶ or [Ar]</p>

Trends within the period	Trends within the group
<ul style="list-style-type: none"> ✓ When we move from left to right across a period the size of the positive ions gradually decreases ✓ The elements on the left side of the table form smaller positive ions ✓ The elements on the right side of the table form larger negative ions 	<ul style="list-style-type: none"> ✓ When we move down a group anions electrons are in orbitals corresponding to higher principal energy levels ✓ Resulting in a gradual increase in ionic size ✓ The ionic radius of positive and negative ions increase

طاقة التأين Ionization energy

✓ That energy is needed to overcome the attraction force between the positive charge of the nucleus and the negative charge of electron

✓ **Example:**

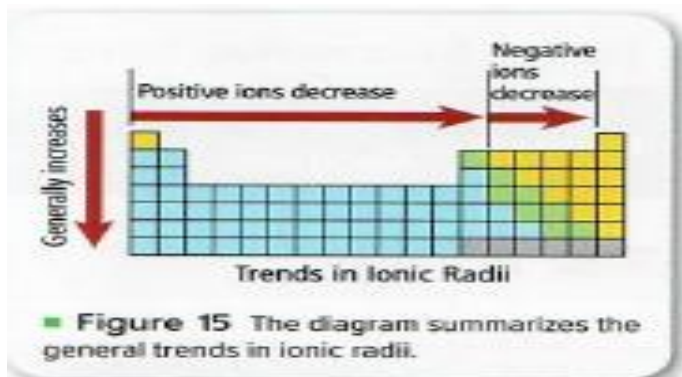

- ✓ Ionization energy **indicate strongly** an atoms nucleus holds onto its valence electrons
- ✓ Atoms with **large ionization energy** values are less likely to form **positive ions**
- ✓ Low ionization energy value indicates an atom loses an outer electron easily
- ✓ Lithium used in computer back up batteries (**why?**) because lithium's low ionization energy where the ability to lose electrons easily makes a battery that quickly provide a large amount of electrical power
- ✓ **Group (1) metals** have low ionization energy and are likely to form **positive ions**
- ✓ **Group (18) noble gases** have **high** ionization energy and are unlikely to form ions because **stable** electron configuration greatly limits their reactivity.

➤ **Removing more than one electron**

Prepared by / mr.Naeem Elemam Akl
0508194296

- ✓ The **second ionization** energy of lithium (7300KJ/mol) much **larger** than its first ionization energy (520 KJ/mol) this means that lithium atom is likely to lose its first valence electron but extremely unlikely to lose its second
- ✓ The **second ionization** energy of element much larger than its first ionization energy (**why?**) Because atoms hold onto their valence electrons

Trends within periods	Trends within groups
<p>✓ When we move from left to right atomic ionization energy increase (why?) because the increased nuclear charge of each successive element produces an increased hold on valence electrons</p>	<p>✓ When we move from up to down ionization energy decrease (why?) because the atomic size increases</p> <p>✓ Less energy is required to remove valence electrons farther from the nucleus</p>

Element	Valence Electrons	Ionization Energy (kJ/mol)*								
		1 st	2 nd	3 rd	4 th	5 th	6 th	7 th	8 th	9 th
Li	1	520	7300	11,810						
Be	2	900	1760	14,850	21,010					
B	3	800	2430	3660	25,020	32,820				
C	4	1090	2350	4620	6220	37,830	47,280			
N	5	1400	2860	4580	7480	9440	53,270	64,360		
O	6	1310	3390	5300	7470	10,980	13,330	71,870	84,080	
F	7	1680	3370	6050	8410	11,020	15,160	17,870	92,040	106,430
Ne	8	2080	3950	6120	9370	12,180	15,240	20,000	23,070	115,380

Octet rule

- ✓ The electron configuration of filled s and p orbitals of the same energy level (consisting 8 Valence electrons) is usually stable

➤ Exceptions of octet rule

The first period elements are complete with only ($2e^-$) valence

➤ Useful of octet rule

- ✓ To determine the type of ions likely to form
- ✓ Elements on the right side of the periodic table tend to gain electrons in order to acquire the noble gas configuration therefore these elements tend to form **negative ions**
- ✓ Elements on the left side of the periodic table tend to lose electrons and form **positive ions**

Electronegativity (linus pauling)

- ✓ When move from left to right across a period **increase**
- ✓ When we move from up to down **decrease**
- ✓ Electronegativity values are expressed in terms of numerical values of 3.98 or less
- ✓ That unit are arbitrary units called paulings
- ✓ **Fluorine** is the most electronegativity element with value of **3.98**
- ✓ **Cesium(0.79)** and **francium (0.7)** are the **least** electronegative elements
- ✓ Noble gases form very few compounds because they don't have electronegativity values

RealWorld CHEMISTRY

Ionization Energy

SCUBA DIVING The increased pressure that scuba divers experience far below the water's surface can cause too much oxygen to enter their blood, which would result in confusion and nausea. To avoid this, divers sometimes use a gas mixture called *heliox*—oxygen diluted with helium. Helium's high ionization energy ensures that it will not react chemically in the bloodstream.

Answer the following question :

- Rank the following elements by increasing atomic radius: carbon, aluminum, oxygen, potassium.
- Rank the following elements by increasing electronegativity: sulfur, oxygen, neon, aluminum.
- Why does fluorine have a higher ionization energy than iodine?
- Why do elements in the same family generally have similar properties?
- Indicate whether the following properties increase or decrease from left to right across the periodic table.
 - atomic radius (excluding noble gases)
 - first ionization energy
 - electronegativity
- What trend in atomic radius occurs across the periodic table? What causes this trend?
- What trend in ionization energy occurs across a period on the periodic table? What causes this trend?
- Circle the atom in each pair that has the largest radius.

a. Al or B	G. Na or Na ⁺
b. Na or Al	H. K ⁺ or Mg ²⁺
c. S or O	I. O or O ²⁻
d. O or F	J. Cl ⁻ or Br ⁻
e. Br or Cl	
f. Mg or Ca	
- Circle the atom in each pair that has the greater ionization energy.
 - Li or Be
 - Ca or Ba
 - Na or K
 - P or Ar
 - Cl or Si
 - Li or K
- Define electronegativity.
- Circle the atom in each pair that has the greater electronegativity.
 - Ca or Ga
 - Br or As
 - Li or O
 - Ba or Sr
 - Cl or S
 - O or S

MULTIPLE CHOICE

- Elements in the same group of the periodic table have the same
 - number of valence electrons.
 - physical properties.
 - number of electrons.
 - electron configuration.
- Which statement is NOT true?
 - The atomic radius of Na is less than the atomic radius of Mg.
 - The electronegativity of C is greater than the electronegativity of B.
 - The ionic radius of Br^- is greater than the atomic radius of Br.
 - The first ionization energy of K is greater than the first ionization energy of Rb.
- What is the group, period, and block of an atom with the electron configuration $[\text{Ar}]4s^23d^{10}4p^4$?
 - group 14, period 4, d-block
 - group 16, period 3, p-block
 - group 14, period 4, p-block
 - group 16, period 4, p-block

Use the table below to answer Questions 4 and 5.

Characteristics of Elements		
Element	Block	Characteristic
X	s	soft solid; reacts readily with oxygen
Y	p	gas at room temperature; forms salts
Z	—	inert gas

- In which group does Element X most likely belong?
 - 1
 - 17
 - 18
 - 4
- In which block is Element Z most likely found?
 - s-block
 - p-block
 - d-block
 - f-block

Mastering Concepts

- What is ionization energy?
- An element forms a negative ion when ionized. On what side of the periodic table is the element located? Explain.
- Of the elements magnesium, calcium, and barium, which forms the ion with the largest radius? The smallest? What periodic trend explains this?
- Explain why each successive ionization of an electron requires a greater amount of energy.
- How does the ionic radius of a nonmetal compare with its atomic radius? Explain the change in radius.
- Explain why atomic radii decrease as you move from left to right across a period.
- Which element has the larger ionization energy?
 - Li, N
 - Kr, Ne
 - Cs, Li
- Explain the octet rule. Why are hydrogen and helium exceptions to the octet rule?

Figure 20

- Use Figure 20 to answer each of the following questions. Explain your reasoning for each answer.
 - If A is an ion and B is an atom of the same element, is the ion a positive or negative ion?
 - If A and B represent the atomic radii of two elements in the same period, what is their order?
 - If A and B represent the ionic radii of two elements in the same group, what is their order?
- How many valence electrons do elements in group 1 have? In group 18?

Figure 21

- Figure 21 shows two ways to define an atomic radius. Describe each method. When is each method used?
- Chlorine** The electron configuration of a chlorine atom is $[\text{Ne}]3s^23p^5$. When it gains an electron and becomes an ion, its electron configuration changes to $[\text{Ne}]3s^23p^6$, or $[\text{Ar}]$, the electron configuration for argon. Has the chlorine atom changed to an argon atom? Explain.
